

an open frame in a short tubular shape;

a blind-end frame in a short tubular shape having a larger diameter than said open frame, both said frames being formed of sheet material having predetermined rigidity;

a body part in a tubular shape of truncated cone formed of sheet material having predetermined rigidity and flexibility which is deformable and has shape retaining ability, said open frame and said blind-end frame being arranged above and below, and integrally connected by way of said body part thereby to compose a container body substantially in a shape of truncated cone in its outer shape; and

a store room for enclosing substance to be extracted such as ground coffee or the like which is continuously provided in a bottom of said blind-end frame,

wherein while not in use, said body part is adapted to be invertibly folded and housed inside said blind-end frame together with said open frame by means of flexibility of said body part thereby to contract said container body, and while in use, said body part is expanded by pulling out of said open frame from said blind-end frame, whereby said container body is expanded and restored to an original cup-like shape.
